No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Adminity cyconies, very prointeraction, very controller. Strong hammal projects are guilation; tissue growth; immunomodulator; activin; inhibin; chemotaxis; chemokinesis; thrombolysis; oncogenesis; proliferation; metastasis; cancer; tumour; haematopoletic disorder; myeloid cell disorder; lymphoid cell disorder; asthma; arthritis; chronic inflammatory condition; proliferative retinopathy; atherosclerosis; coronary heart disease; arterial ischaemia; bone disorder; osteoporosis; vascular growth disorder; tissue regeneration; wound healing; infection; immune disorder;

KW inhibin; Chemotaxis; chemokinesis: thrombolusis: activin;
--

Mismatches:

```
cell culture; drug screening; gene therapy; antiinflammatory; antiasthmatic; antiarthritic; haemostatic; antiarteriosclerotic; cytostatic; osteopathic; vasotropic; cardiant; virucide; antibacterial; antifungal; vulnerary; antiulcer.

The sequences ABA0825-ABA09574 represent nucleic acids encoding them. The computation also relates to vectors and recombinant host cells comprising a nurleotide of the invention, methods of percenting the nucleotides against the polypeptides, methods of detecting the nucleotides of the invention, and though novel, many of the nucleotides of the invention have homology to known proteins, thereby collypeptides of the invention have homology to known proteins, thereby collypeptides of the invention have homology to known proteins, thereby coptential therapeutic applications. The polypeptides of the invention may potential therapeutic applications. The polypeptides of the invention may corential therapeutic applications. The polypeptides of the invention may corential therapeutic activities; tensue growth activity; and affected affected activities; receptor or inhibin-related activities; characteric or chemokinetic activities; haemostatic, thrombolic or chemokinetic activities; haemostatic, thrombolic or chemokinetic activities; haemostatic, thrombolic or chemokinetic activities; naceptor or inhibin-related activities or may be thrombolytic activities; acner cell proliferation or metastasis.

Companied in oncogenesis, cancer cell proliferation or metastasis.

Companied in oncogenesis, cancer cell proliferation or metastasis.

Conditions, e.g., by protein or agene therapy. Such conditions include conditions, e.g., by protein or agene therapy. Such conditions include conditions; e.g., mypopetides and activities may be used to promote verial and fungal infections in disorders (e.g., myeloid or propertic disorders (e.g., myeloid or proliferative retinopathy athrosoclerosis, coronary heart of surface repair (or nucleic acids encoding them) may be used to promote with growth. Polypeptides such proliferations in addition to immune disorders (e.g., capaling or promote cell growth. For 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human polypeptide of the invention.

This represents a human amino acid permease homolog (AAPH). The AAPH nucleic acid, protein, AAPH (ant)agonists are useful in the diagnosis, treatment and prevention of cancer such as adenocarcinoma, leukemia, lymphoma, melanoma, myeloma, sarcoma, teratocarcinoma, and cancers of the adrenal gland, bladder, bone, bone marrow, brain, breast, cervix, gall bladder, ganglia, gastrointestinal tract, heart, kidney, liver, lung, muscle, ovary, pancreas, parathyroid, penis, prostate, salivary glands, skin, spleen, testis, thymus, thyroid or uterus; inflammatory/autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amino acid permease homolog; AAPH; cancer; inflammatory disorder; AIDS; autoimmune disorder; anemia; asthma; atherosclerosis; diabetes mellitus; multiple sclerosis; osteoarthritis; osteoporosis; rheumatoid arthritis; ulcerative colitis; infection; cell proliferation disorder; human.
                                                                        the development of cancer. The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonucleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence is human T cell epitope related to lung tumour-specific protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New human amino acid permease homolog, useful in the diagnosis, treatment and prevention of cancer, inflammatory/autoimmune disorders and cell proliferation disorders -
The invention relates to isolated lung tumour-specific proteins and their corresponding cDNA molecules. Lung tumour-specific proteins and their antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer. The invention also relates to a composition
                                                                                                                                                                                                                                                                                                                                                                                                   104 TICCAGGCCAAITGIGGCATAGATTITAICAIATICTGGATTITIGG 151

AAPH polynucleotides and polypeptides are useful for diagnosis, treatment and prevention of cancer e.g. adenocarcinoma, lung cancer, ovarian cancer; inflammatory/autoimmune disorders e.g. ALDS, Crohn's disease, rheumatoid arthitis; and cell proliferation disorders e.g. arteriosclerosis, psoriasis, hepatitis. AAPH polynucleotides are useful in gene therapy, in PCR-based methods for detecting upstream sequences, and also for

```
This invention describes a novel protein MONP-2 (I) and its encoding gene monp-2 (II) with a cell proliferation promoting effect isolated from a human peripheral blood. The new protein (I) and gene are useful in studying the expression abnormality and dysfunction of (I) as well as maintenance of immune function and development of drugs for e.g. immune diseases and cancers. This represents encodes the MONP-2 protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel gene monp-2 encoding monocyte-specific protein with cell proliferation promoting effect, useful in studying its expression and immune function, and in developing drugs for e.g. immune diseases and

These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic collitis or ulcerative collitis. The present sequence is a digestive system antigen of

Sodium independent small neutral amino acid transporter; cell resistance; oxidizing stress; NMDA type glutamate receptor; cell {\sf growth}.
The present sequence represents a sodium independent small neutral amino acid transporter polypeptide. The polypeptides and polynucleotides are used for controlling cell resistance to oxidizing stress, NMDA type glutamate receptor activity, cell growth and for screening for substances that have these activities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sodium independent small neutral amino acid transporting proteins

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or egeptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, heematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activitianian activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
The present sequence represents a sodium independent small neutral amino acid transporter polypeptide. The polypeptides and polynucleotides are used for controlling cell resistance to oxidizing stress, NMDA type glutamate receptor activity, cell growth and for screening for substances that have these activities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 20; SEQ ID NO 26487; 1399pp + Sequence Listing; English.

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA019310) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated polynucleotide (I) and colypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome comparate chain reaction (PCR) primers, oligomers, and for chromosome comparation of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for restore normal activity of (II) is useful in gene therapy techniques considentifying expressed genes. (I) is useful in gene therapy techniques considentifying activity of (II) or to treat disease states involving considentiating a polypeptide in tissue, as molecular weight markers and as a molecular weight markers and as a magning of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. Calagnostics, foreniscs, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and canno acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
